Sect. I. D Y E IN G. 2569

Region region-0; provider order 0.

Hypothle: concerning tharation of the con hour.

Region region-1; provider order 1.

Mr Heller, hypothle diperced.

Region region-2; provider order 2.

Mr Heller, hypothle diperced.

Region region-3; provider order 3.

Laure of in prestatues, or inome of the dying in-gradient themselves. He happens that the pores of the fluff are cleaned and enlarged by the preparatory falls, and by the boiling water, is fach a manner as to receive the colouring particles, which particles are afterwards detailed by the contraction of the pores co- cailoned by cold; and further, that these pores are linked with a false craft of tartor or viriolated tartar.

Region region-4; provider order 4.

On this theory, the transfer of the Chemical Dic-tion has the following observations. ” Mr Heilot has not shown that pore fixed alkali is incapable of producing the effects which he attributes to his tartar and viriolated tartar; and both their falsa, though they are difficult for solution and require great quantity of water for this purpose, will yet diffuse at halt a shell therefor, if the coloring particles were fixed directly by means of their falsa, they might be washed out by a large quantity of water; which we find to be contrary to experience.

Region region-5; provider order 5.

We shall find it more difficult to fulfillute a true theory, than to refute that of Mr Hellot. Many ex- prinements ought to be previously made. Nevertheless it may be delivered, then the colorite particles of mold fubliances used in dyeing femen to be insoluble in wa- ter, in spirit of wine, and even in alkaline likivions; that their diffusion thief liquids is useful merely their afterdefon to certain gummous and refonos particles; and that they may be infangaged from those gummy and reduces matters, by applying a piece fluff in, which they have a greater adhesive power, which forms to be the cake of the root-coloured and blue dyes, or by applying another forbidden to which thefy particles have a greater power of adhesion; fich as the earth of alum, in thofe dyes where that fall is and, together with some other folklance, as fast or reohicile alkali, capable of developing alum; or as the ferruginous earth of the green vitrol in black dyes, which the colorite particles of the galls adhere; which carries the capable of applying thematives and of adhering to the fluffs. The leparation of the col- turing particles from the gummy and refonos mat- ness is probably facilitated by the addition of acids and neutral salts, which may recognize in force machine the vegetable matters, and leave the colorite particles dif- engaged; fis that, they apply themselves to the fluff, or to the earth above-mentioned!?

Region region-6; provider order 6.

But, in whatever way the falls used in dyeing do selt, it is certainly they are capable, except in a very few influence, of being and giving a bults and promenancy to the colour which otherwise could never be obtained. The exception to this general skin most commonly known, is that of indigo. This is a fine blue levels produced by fermentation from the leaves of the In- chain plans called cool. It is very difficult of

foliation; however, it may be distilled by alkaline fats, concu- trated oil of virilol, orpiment, or combinations of hal- phare quickokine. If a quantum if judge is diffi-ed in a flattal ability, evolute alkalies will not differ love it), the lotion is always green, which is the natural colour produced all vegetable blose by the blacks but if any piece of fluff is put into the fashion, though it remains green while immersed in the liquid, the moment it comes in coastal with the air, the dif- folking power of the anaklit to totally defeyed; the n- digo is precipitated upon the cloth, refumes its native colors, and dyes the choice bloc.

Region region-7; provider order 7.

The results of this preparation is very difficult to be investigated. Perhaps it may be owing to an att- traction of fixed air by the alkali from the atom- phen, which renders the fat unrable to diffuse the indigo any longer. The collection of the colour femes merly owing to an attraction between it and the cloth; for the alkaline felt can contribute nothing to this, but would.
